Niigata's Quince Blossoms

■ Japanese Quince [Chaenomeles speciosa]

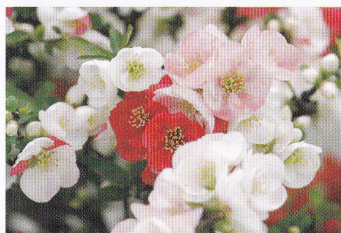

Niigata City ranks top in Japan in terms both of the quality and the quantity of its Japanese quinces, accounting for 90% of Japan's quince production. Repeated variety improvements mean that today there are over 200 varieties. In addition to single-layer varieties, multi-layer varieties are also found. Some varieties produce white and red flowers on the same branch while others have flowers that change color. Widely used as a garden shrub and in bonsai, this shrub is cultivated mainly for ornamental purposes.
